(57)ABSTRACT

A composite body including a substrate with a front side, a rear side and an outer edge, and an electrically conductive paper layer, wherein the electrically conductive paper layer is at least partially arranged on the front side of the substrate and at least partially encompasses at least two conductive tracks. The at least two conductive tracks are at least partially arranged on the rear side and/or the outer edge of the substrate. Further described is a use of the composite body and a method for producing a composite body. Further described is a contacting device for electrically contacting an electrically conductive paper layer of a composite body.
