(57)ABSTRACT

A rotating body for a rotation restricting mechanism rotates integrally with a motor, and the rotation of the rotating body is restrictable by engagement with an engaging pin. The rotating body includes a plurality of radial-support parts that extend in a radial direction, with the inner end portions thereof connected to the motor, a plurality of first-circumferential-connecting parts each connecting the inner end portions of two mutually-adjacent radial-support parts, a plurality of second-circumferential-connecting parts each connecting the outer end portions of two mutually-adjacent radial-support parts, and a plurality of engaging protrusions provided in the outer end portions of the radial-support parts. Two mutually-adjacent engaging protrusions in the circumferential direction have an interval therebetween that allows movement of the engaging pin in the circumferential direction between the two mutually-adjacent engaging protru-
