#### (57)**ABSTRACT**

A wire cover is to be mounted on a rear side in a connecting direction of a connector to be connected to a mating connector. The connector includes a plurality of female terminals disposed apart from each other in a lateral direction and a plurality of wires connected to the respective female terminals and pulled out from the rear side in the connecting direction. The wire cover includes a housing having an insertion opening through which the plurality of wires are inserted and a draw-out opening through which the plurality of wires inserted through the insertion opening are drawn out rightward, and an assisting member for assisting threedimensional bending of the respective wires inside the housing. The respective wires are three-dimensionally bent inside the housing and drawn out through the draw-out opening by being assisted by the assisting member.
