ABSTRACT

An inverter includes a capacitive module and a first power module connected to the capacitive module by a first DC connection and includes a first AC connection arranged on an opposite side of the first power module. A second power module is connected to the capacitive module by a second DC connection and includes a second AC connection arranged on an opposite side of the second power module. The power modules are arranged on the same side of the capacitive module, on either side of a median plane of the capacitive module, the AC connections being closer to the median plane of the capacitive module than the DC connections.
