ABSTRACT (57)

A method for actuating an electric motor includes modulating a drive power provided to the electric motor by using a ramp function for a change in rotational speed of the electric motor from a starting rotational speed to a target rotational speed. The target rotational speed is only reached after at least 200 ms, starting from the starting rotational speed. An apparatus, a fully automatic coffee machine having the apparatus, a computer program product and a computerreadable storage medium are also provided.
