ABSTRACT (57)

An apparatus configured to: transmit, to a UE, signaling for scheduling retransmission of at least one transport block of a bundle of uplink transmissions, including at least one of: an indication of at least one resource for the retransmission, an indication of whether a duplicate of the at least one transport block, or a redundant version of the at least one transport block is to be retransmitted, an indication of a MCS for the retransmission, an indication of a periodicity for the retransmission, an indication of the at least one transport block to be retransmitted, an indication of a link between the signaling for scheduling the retransmission of the at least one transport block and another scheduling grant, an indication of a hybrid automatic repeat request process to perform, or an indication of a hybrid automatic repeat request process number associated with the at least one transport block.
