(57)**ABSTRACT**

An appliance has an insulated compartment with a door that is movable between a closed position and an open position for accessing an interior cavity of the insulated compartment. A window panel is disposed at the door for viewing the interior cavity when the door in in the closed position. A display overlays at least a portion of the window panel, so as to display information that is visible at an exterior surface of the door. The display is also at least partially transparent for viewing the interior cavity through the window panel and the display. A transparent thermal insulator is disposed between the window panel and the display to prevent the interior cavity from heating or cooling the display outside of an operating temperature range.
