#### (57)**ABSTRACT**

A method of manufacturing a power storage cell includes: a preparing step of preparing an electrode sheet including a current collecting foil and an active material layer; a cutting step of forming a plurality of cuts in the current collecting foil to form a plurality of connecting pieces; and a winding step of winding the electrode sheet around a winding core while bending each of the connecting pieces. The current collecting foil prepared in the preparing step includes a main region and an end region, and the end region includes an edge portion. In the cutting step, a plurality of cuts are formed in the end region to form connecting pieces each having a wide portion and a narrow portion between a pair of cuts. In the winding step, the electrode sheet is wound around the winding core while bending each connecting piece at the narrow portion.
