(57)**ABSTRACT**

A power control method and an electronic device for performing the method are disclosed. A power control method according to various embodiments may comprise: receiving an input for turning off the power of an electronic device; identifying the voltage of a battery based on the input being received; determining, based on a set margin voltage and the voltage of the battery based on the input being received, a reference voltage for entering a ship mode preventing and/or reducing discharge of the battery caused by leakage current; turning off the power of the electronic device; monitoring the voltage of the battery after turning off the power of the electronic device; and setting the electronic device to the ship mode based on the monitored voltage of the battery and the reference voltage.
