(57)ABSTRACT

A display device includes a display panel including pixels and a data driver configured to supply a data signal to the pixels. The display panel includes data lines, a high potential voltage line, and one or more reference voltage lines. Each of the pixels includes first to fourth sub pixels, and the data lines include first to fourth data lines which supply the data signals to the first to fourth sub pixels, respectively, and extend along a second direction. Further, each of the first to fourth sub pixels includes a light emitting diode and a circuit element configured to drive the light emitting diode. The first to fourth data lines are disposed between the circuit elements of two adjacent sub pixels extending along a first direction different from the second direction, among the first to fourth sub pixels.
