(57)ABSTRACT

A charging control device including a controller that controls charging a battery that is mounted on a vehicle using an external power, wherein the controller is able to set a first charging mode in which charging is completed when a state of charge becomes a first target of charge close to full charging, and further is able to set a second charging mode in which charging is completed when a state of charge becomes a second target state of charge that is lower than the first target state of charge, and the controller is configured to: in a case of the first charging mode, control a timing when charging is completed based on a traveling due time, and in a case of the second charging mode, execute control such that the timing when charging is completed before the timing when charging is completed in the first charging mode.
