#### (57)ABSTRACT

To provide a rotary electric machine that the cooling performance of the winding part on the axial direction one side with connection can be higher than the cooling performance of the winding part on the axial direction other side with no connection. A motor cooling passage provided in an outer circumferential part of the stator is provided with circumferential direction parts that is provided with an one side circumferential direction passage and an other side circumferential direction passage; and circumferential direction parts that is provided with an axial direction passage, wherein a length of a part of the one side circumferential direction passage which exists on an upstream side of a center position of a total length of the motor cooling passage is longer than a length of a part of the other side circumferential direction passage which exists on the upstream side of the center position.
