(57)**ABSTRACT**

The invention pertains to a method for laminating solar cells, comprising: attaching a first side encapsulant (114) to solar cells, which first side encapsulant is made of a first encapsulant material, the first side encapsulant being attached to one of the photosensitive side and the backside of the solar cells forming at least a part of a stack by, after attaching the first side encapsulant to the solar cells, attaching a second side encapsulant (112) to the other one of the photosensitive side and the backside of the solar cells, the second side encapsulant (114) being made of a second encapsulant material which is different from the first encapsulant material, and wherein the first encapsulant material has a change of dimensions which is less than the change of dimensions of the second encapsulant material.
