#### (57)ABSTRACT

A semiconductor light receiving element in which a photodiode is formed on the main surface side of a first semiconductor substrate, and a cone ave mirror reflecting an incident light toward the light receiving element. The concave mirror comprises a flat first surface of the second semiconductor substrate that is transparent to the incident light, a convex surface formed in a convex shape toward the side opposite to the first surface on the second surface side opposite to the first surface, and a reflective film formed on the convex surface, and the incident light entering from the first surfaceside is reflected by the reflective film to a condensing positionnear the first surface, and the light receiving element was fixed to the first surface so as to overlap the light focusing position of the concave mirror.
